Material: Technopolymer

Features: Made up of two overlapping half-ridges composed of a linear part (which maintains the pitch of the sheet) and a smooth semi-circular element that allows the overlapping and sloping with an angle between 90°-170°. The hinged ridge allows the continuity of coverage between slopes that might not be aligned.

Use: Essential for connecting the intersection points of the horizontal roof planes, thus making the roof continuous also in terms of water tightness.
